Digital Diagnostic Functions

SFP-10/25G-BIDI-LR-Txxxx/Rxxxx-x-C10 supports the 2-wire serial communication protocol as defined in SFF-8472. Digital diagnostic information is accessible over the 2-wire interface at the address 0xA2. Digital diagnostics for the transceiver are internally calibrated by default. A micro controller unit inside the transceiver gathers the monitoring information and reports the status of transceiver, such as Transceiver Temperature, Supply Power, TX bias current, TX output power and RX received optical power.

Functions Description

MODULETEK’s SFP-10/25G-BIDI-LR-Txxxx/Rxxxx-x-C10 module consists of a microcontroller, integrated dual-clock data recovery function (CDR) laser drive and limiting amplifier, and a Transmitter and a Receiver.

The microcontroller communicates with the host via a 2-wire serial communication interface, providing module control, status reporting and monitoring functions (DOM). This product Compliant with SFF-8472.

The laser driver amplifies the high-speed differential signal recovered from the TX CDR, and drives the laser to generate an optical signal, and maintains the stability of the transmitted optical power through an automatic optical power control feedback loop.

The limiting amplifier amplifies the electrical signal converted by the light receiving component, and outputs the fixed frequency signal to the RX CDR. At the same time, the limiting amplifier detects the amplitude of the electrical signal converted by the light receiving component, and if it is lower than the set threshold, it reports that the received signal is lost, and raise the RX_LOS pin level on the gold finger. LOS signal is only related to the amplitude of the electrical signal, not to the signal rate and whether the CDR is locked or not.

The transmitter of the transceiver adopts a TO-CAN structure within a BOSA, and is composed of a DFB

laser and a monitoring photodiode(MPD). The laser generates a corresponding optical signal according to a bias current and a modulation current provided by the laser driver, and the MPD will continuously monitor the TX power.

The Receiver of the transceiver also uses a TO-CAN structure within a BOSA, including a PIN photodetector(PIN PD) and a trans-impedance amplifier(TIA). When ROSA detects the incident light signal, it will be converted into photo-generated current by the PIN PD. The photo-generated current is converted into an electrical signal through the TIA and input to the limiting amplifier.

The transceiver supports high data rates 24.33G/25.78G(CPRI options 10/25GbE) and low data rates 9.95G/10.31G(10GbE-LW/LR) CDRs at transmitter and receiver are configured according to different signal rates, as shown in the following table.

Logic OR of RS0 Pin and Bit110.3 of A2H	Logic OR of RS1 Pin and Bit118.3 of A2H	RX Data Rate	TX Data Rate	Status of RX CDR	Status of TX CDR
Low/0	Low/0	9.95G/10.31G	9.95G/10.31G	CDR Bypassed	CDR Bypassed
Low/0	High/1	9.95G/10.31G	24.3G/26.5G	CDR Bypassed	CDR Engaged
High/1	Low/0	24.3G/26.5G	9.95G/10.31G	CDR Engaged	CDR Bypassed
High/1	High/1	24.3G/26.5G	24.3G/26.5G	CDR Engaged	CDR Engaged

We can provide different CDR configurations for different applications, such as 25G single-rate application, full-rate CDR bypass application and so on. For more details, please contact our sales.
