### MODULETEK: SFP-GE-BIDI-80KM-T1490/R1550-x-D10

1.25Gb/s SFP (Small Form Pluggable) Tx1490nm/Rx1570nm Bi-directional Transceiver

### Overview

ModuleTek's SFP-GE-BIDI-80KM-T1490/R1550-x-D10 SFP-BIDI optical transceivers are based on Gigabit Ethernet IEEE 802.3 standard and Fiber Channel FC-PI-2 Rev 7.0 , providing a fast and reliable interface for GE/FC applications. The product implements digital diagnostics via a 2-wire serial bus , compliant with the Small Form Factor Pluggable Multi-Source Agreement (MSA)and SFF-8472 standard.

### Product Features

- Up to 1.25 Gb/s data links
- Single LC connector
- Compliant with IEEE 802.3z Gigabit Ethernet
- Compliant with SFP MSA
- Hot-pluggable SFP footprint
- 1490nm DFB laser transmitter
- Built-in digital diagnostic functions
- Up to 80km on 9/125um SMF
- Single power supply 3.3V
- RoHS Compliant
- Class 1 laser product complies with EN 60825-1
- Operating temperature range(Case Temperature):  
Commercial Level : 0°C to 70°C  
Industrial Level : -40°C to 85°C

### Applications

- 1.25Gb/s Gigabit Ethernet
- 1.063Gb/s Fiber Channel

## Digital Diagnostic Functions

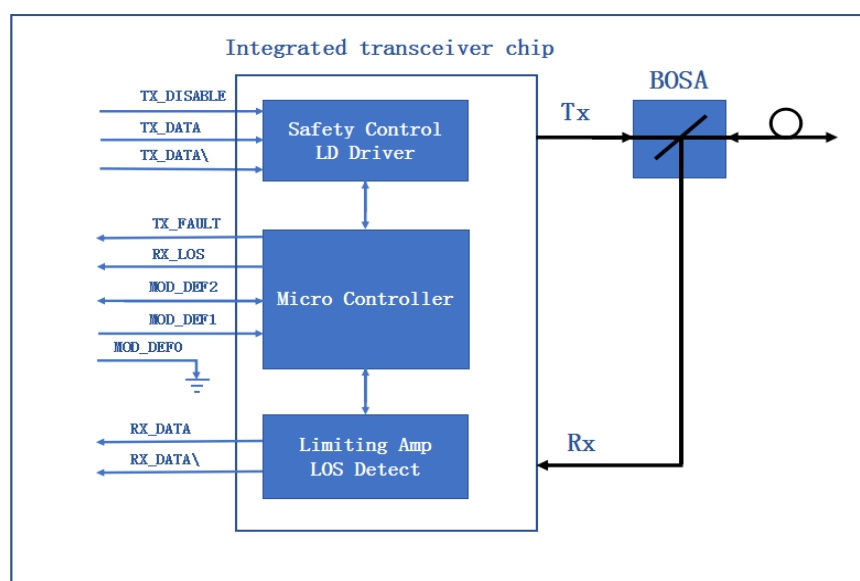

SFP-GE-BIDI-80KM-T1490/R1550-x-D10 supports the 2-wire serial communication protocol as defined in SFP MSA . Digital diagnostic information is accessible over the 2-wire interface at the address 0xA2. Digital diagnostics for SFP-GE-BIDI-80KM-T1490/R1550-x-D10 are internally calibrated by default. The internal micro control unit accesses the device operating parameters in real time,Such as transceiver temperature, laser bias current, transmitted optical power, received optical power and transceiver supply voltage.The module implements the alarm function of the SFP MSA ,alerts the user when a particular operating parameter exceeds the factory-set normal range.

## Block-Diagram-of-Transceiver

## Functions Description

The transmitter is mainly composed of a laser driver part of the intelligent transceiver chip and a TOSA (light-emitting component), the TOSA includes a 1490nm DFB laser and a backlight photodetection chip, When the module is working, the input signal is connected to the intelligent transceiver chip, at this time, the laser driver of the intelligent transceiver chip supplies the bias current and the modulation current to the laser.

The intelligent transceiver chip simultaneously uses an automatic optical power control (APC) feedback loop to maintain a constant average optical power of the laser output. The purpose is to eliminate the change of the output optical signal due to temperature changes and aging of the light source device. When the transmitter enable pin (TX\_Disable) is high (TTL logic "1"), the laser output is turned off. When TX\_Disable is low (TTL logic "0"), the laser will turn on within 1ms. When the transmitter fault signal (TX\_Fault) is reported as high, indicates a transmitter failure caused by the transmitter's bias current or transmitted optical power or laser tube temperature exceeding a preset alarm threshold. Low indicates normal operation.

The receiver is mainly composed of a limiting amplifier part of the intelligent transceiver chip and a

ROSA (light-receiving component),the ROSA includes a PIN photodetector and a transimpedance amplifier chip.When the ROSA detects the incident light signal, it will be converted into a photo-generated current by the PIN photodetector. The photo-generated current is converted into an electrical signal after passing through the transimpedance amplifier. The electrical signal is further amplified by the limiting amplifier of the intelligent transceiver chip, then outputs a fixed-amplitude electrical signal to the host.

When the amplitude of the electrical signal received from the incident light conversion of the opposite optical transceiver module is lower than the set threshold,the module reports that the received signal is lost,the RX\_LOS pin is high (logic “1”),which can be used to diagnose whether the physical signal is normal.The signal is operated in TTL level.The implementation method of RX\_LOS is OMA(optical modulation amplitude).

The microprocessor inside the module monitors the module’s operating voltage, temperature, transmitted optical power, received optical power, and laser bias current value in real time. The host acquires this information over a 2-wire serial bus.

## A0h/A2h Write Protection

Security Level 1 Password:

Password Entry ADDR	Size	Vaules(hex)	Remark
Page A2h,7Bh-7Eh	4	12 34 56 78	

After the module is powered on, the read value of the security level access registers 7Bh to 7Eh of A2h is replaced with 0xFFh.

After entering the security level 1 working state, the user can directly write to the contents of the A0h device address and Table 00h and Table 01h of A2h device address.

And this version of the module does not support users to modify the security level 1 password.

### Notes:

1. Circuit ground is isolated from chassis ground
2. Disabled: T<sub>DIS</sub> > 2V or open, Enabled: T<sub>DIS</sub> < 0.8V
3. Should Be pulled up with 4.7k – 10k ohm on host board to a voltage between 2V and 3.6V
4. LOS is open collector output
